Speaker notes – Tableau story (5 points, ≈ 2:40)

*Draft for Jacklynn · talking to Elena and the leadership team directly ("your perks") · times follow the presentation plan (total ≈ 5:00 with the 3 intro slides and the closing slide) · **bold** = what to click · say it in your own words, the numbers are the part to keep exact.*

---

Before you start (≈ 2 min)

- Open the link in the browser, log in if needed, and click through all five points once, so nothing loads for the first time while you're talking.
- Start states: map on **North America**, treemap on **Perk → segments** with nothing open, persona **Hotel Stayers**, perk detail **No cancellation fees**.
- Keep the PDF backup (`TravelTide_story_backup.pdf`) open in a second tab, in case Tableau Public or the Wi-Fi is slow.
- Full screen: the browser's full-screen mode (F11), or the full-screen button at the bottom of the Tableau Public view.

Switch from the slides (0:10)

> "Let me show you what's behind that answer, in the dashboard."

1 • Customers & trips (0:25)

Show: the KPI tiles, then the map.

> "These are the customers we're talking about: 5,998 engaged customers, with more than seven sessions since January 4. Together they had 49,211 sessions and 15,489 trips they didn't cancel – about 2.6 per customer, and 17.9 million dollars after discounts."

Click: **World**, then back to **North America**.

> "99.2 % of their flights stay in North America – so 'long-haul' here means coast to coast. That will matter for one of the perks."

2 • Nine groups (0:40)

Show: the treemap *Perk → segments*.

> "Every customer gets exactly one perk. The tiles are sized by customers – your no-cancellation perk and the free hotel night are the biggest."

Click: **Free hotel meal** (it opens into its segments).

> "Inside the free hotel meal: 616 Hotel Stayers and 417 Family Crew get it through a segment rule, and 238 All-rounders through their perk score. For customers without a clear habit, I scored how strongly they lean toward each perk's behavior compared with the average booker, and gave them the perk with the highest score." "A customer can match several rules, so we check them in

a fixed order – specific habits first, broad ones like discounts or packages last. The first match decides, so everyone is in exactly one group."

Click: the tile again to close it.

3 • Habit or luck (0:40)

Show: the chart *Real count ÷ luck*.

"Before trusting any group, I checked whether its behavior is a habit or just luck. I shuffled all trips between customers 50 times and counted again – a rule only counts as a habit if the real data beats 95 % of those shuffles." "Hotel-only stays are 26 % above luck, packages 17 %, long distances 9 % – those are habits. Discounts, checked bags and weekend trips sit inside the luck range."

Point at: *Are the Dreamers real?*

"And the Dreamers are real: 458 customers never book – about twice as many as chance would predict, 236."

4 • Perks & personas (0:25)

Show: the perk bars.

"Here's the final split per perk – dark blue by segment rule, light blue by perk score."

Click: Long-haul Travelers in the table.

"And here's a real customer behind a segment: customer 521379 from New York flies 3,729 kilometers on average, but doesn't check more bags than anyone else. So instead of the free bag, the perk is the new extra-legroom seat – and the bag becomes the pilot."

Click: Hotel Stayers again (start state).

5 • Recommendation (0:30)

Show: the three cards at the top.

"So my recommendation: launch the four habit-backed perks now – 4,769 customers, 80 %. Test exclusive discounts and the free checked bag first – those 1,229 customers still get a perk, it just has to prove itself."

Point at: *How we measure success*.

"Every perk is compared with a random control group, and today's numbers are the baseline: a 33.1 % booking rate, 2.6 trips per customer, 3.8 % cancellations. After three months we keep what beats the control, switch the rest to the pilot – like the 48-hour fare lock for the Dreamers – and re-run the segmentation every quarter."

Back to the slides (0:10) → closing slide

If you have 7 minutes instead of 5 (+ ≈ 1:15)

- **3 · ML cross-check (0:30):** point at the machine-learning card – "Three algorithms that never saw my rules – K-Means, DBSCAN and PCA – found 4 of the 7 booker groups on their own. Clustering shows who is similar; the shuffle test shows whether it's a habit."
- **2 · Segment → family status (0:20):** click **Segment → family status** – "The same customers by segment, and inside each segment by family status." Then back to **Perk → segments**.
- **4 · A second persona (0:25):** click **Dreamers** – "Customer 567824 from Ottawa: eight sessions, no trip kept. Free cancellation takes the risk out of the first booking."

If someone asks (short answers)

- **How is the perk score calculated?** (notebook 3, section 4.1) "Each of your five perks gets the behaviors behind it – for example nights per stay and hotel-only share for the hotel meal, bags per trip for the checked bag. Every behavior is standardized, so 0 is the average booker and +1 is one standard deviation above. A perk's score is the average of its behaviors, and all five scores are put on the same scale, so a perk built on one behavior doesn't win more often. The All-rounders get the perk with their highest score. For segment members it's only a cross-check: for 57 % of them the highest score points to the same perk as their rule."
- **What is the City Stamp Card?** "A digital punch card for one city: every trip to the same city earns a stamp, and the 3rd trip unlocks a local extra, like a free airport transfer or a restaurant voucher. It rewards exactly what Favorite-City Returners do, and it's a pilot because their repeat habit is only slightly above luck."
- **What is Bring-a-friend?** "A referral perk for Couples & Friends: when a customer brings someone new who books or signs up, both get a credit on the next trip. They already travel together – a party of 2+ is a habit, 13 % above luck."
- More Q&A: game plan, section 7 (why rules + ML, why k = 8, why discounts are tested first, Couples & Friends and no cancellation fees).

If a click doesn't work

Stay calm and say the sentence anyway – the numbers are in these notes. If Tableau Public hangs, switch to the PDF backup tab: the same five points, just without clicking.
